

Stakeholder Analysis Document

End-to-End Salesforce CRM Transformation for
Customer Operations and Service Management

1.1 Project Charter

1.1.1 Project Overview

GreenGrid Utilities is a mid-sized provider of energy and utility services facing substantial operational challenges as a result of a highly disjointed system environment. The organization currently depends on numerous disconnected legacy platforms, manual data entry practices, and siloed spreadsheets to administer core customer records, coordinate field dispatch activities, and manage on-site operations.

This fragmented infrastructure leads to redundant data entries, prolonged case resolution timelines, and limited real-time visibility for senior management into operational performance. To comprehensively address these challenges, GreenGrid Utilities is undertaking a strategic transition to Salesforce as a unified Customer Relationship Management (CRM) platform. This initiative brings together customer operations, internal service desk functions, and infrastructure dispatch coordination under a single, authoritative system.

1.1.2 Problem Statement

The existing technology environment at GreenGrid Utilities lacks the capability to support cohesive, cross-departmental collaboration. Customer records are scattered and duplicated across regional repositories, field dispatch processes depend entirely on verbal communication, and executive leadership has no immediate access to dependable service delivery performance data.

The absence of a centralized system makes it increasingly difficult for the organization to consistently deliver high-quality, responsive customer service.

1.1.3 Project Scope

The project boundaries are clearly defined to maintain control over delivery and prevent unplanned scope expansion. To meet the necessary data management requirements without reliance on live external system feeds, legacy operational data will be imported directly into Salesforce using standard data loading utilities.

In Scope	Out of Scope
Consolidated customer data governance and account profiles	Financial administration and utility billing systems
Sales pipeline management and account relationship tracking	Real-time synchronization with external third-party platforms
Customer service support and phone-based case documentation workflows	Customer-facing self-service digital portals
Field service scheduling, dispatch coordination, and technician task tracking	Proprietary mobile application development

1.2 Stakeholder Identification

Stakeholders represent the individuals and organizational groups who are directly engaged in, or meaningfully affected by, the Salesforce CRM implementation initiative.

1.2.1 Internal Stakeholders

- Executive Management: Senior leadership requiring clear and consolidated operational data views.
- Customer Support Team: Front-line service agents responsible for processing incoming customer requests and issue reports.
- Field Technicians: Specialized engineers who carry out physical utility maintenance and on-site service tasks.
- Sales Team: Business development representatives managing client account acquisition and relationship activities.
- IT / System Administrator: Technical personnel overseeing platform configuration, governance, and security.

1.2.2 External Stakeholders

- Customers: End-users who receive local utility distribution services and are directly impacted by service quality.

Each identified stakeholder group carries distinct operational priorities, day-to-day responsibilities, and degrees of influence over the platform configuration and implementation approach.

1.3 Stakeholder Analysis Matrix

The matrix below assesses GreenGrid Utilities stakeholders based on their degree of organizational authority (Power) and their level of operational impact and engagement (Interest) relative to the CRM transformation initiative.

Stakeholder Group	Role in Organization	Interest Level	Power Level	Key Needs and Operational Concerns
Executive Management	Strategic decision-makers	High	High	Live analytical dashboards and integrated operational performance reporting.
Customer Support Team	Front-line service desk representatives	High	Medium	Efficient data retrieval tools and a consolidated, intuitive case management interface.
Field Technicians	On-site infrastructure service engineers	High	Medium	Organized task records, accurate location data, and elimination of paper-based administrative processes.
Sales Team	Client acquisition and account managers	High	Medium	Unified client history records and thorough removal of duplicate account entries.
IT / System Admin	Platform governance and	Medium	High	Flexible data architecture, rule-based automation

	configuration specialists			frameworks, and comprehensive access control.
Customers	End-users of utility distribution services	High	Low	Reduced wait times on support lines and prompt resolution of service interruptions.

1.4 Business Objectives Definition

1.4.1 Defined Business Objectives

a. Streamline Customer Support Operations:

Reduce call center processing burden by accelerating data retrieval and simplifying case tracking workflows.

b. Ensure Data Accuracy and Consistency:

Implement a consolidated native data schema to systematically eliminate duplicate customer records and ensure data integrity across the organization.

c. Enable Real-Time Operational Visibility:

Equip executive leadership with up-to-date operational metrics through built-in reporting and dashboard capabilities.

d. Integrate Internal Communication Channels:

Establish seamless connectivity between customer service case logs and active field maintenance dispatch activities within a unified platform.

1.4.2 Success Indicators

a. Average Handling Time (AHT) Reduction:

A quantifiable decrease in the time required for service agents to record and process incoming customer issues.

b. Duplicate Record Elimination Target:

A measurable reduction in the number of redundant customer account and contact entries within the system.

c. Dashboard Utilization Rate:

Regular and sustained usage of live reporting tools by management teams as a primary decision-making resource.

Conclusion

This stakeholder analysis provides a comprehensive foundation for understanding who is involved in the project, the extent of their authority, and what they expect from the implementation. It also articulates the core business objectives that will inform the design and configuration of the Salesforce CRM solution throughout subsequent project phases.

Ensuring clear alignment between stakeholder requirements and defined business goals is fundamental to delivering a solution that generates meaningful, lasting value for GreenGrid Utilities.
